Dataset & Data Dictionary

Schema, validation rules, provenance, and responsible data handling

Prepared for: Pratyush Mishra
Version 1.0 • 15 October 2026
Status: Working companion document

1. Purpose

- Use this document alongside the actual phones.csv. It describes the expected schema; it does not claim a real dataset has already been sourced.

2. Suggested columns

- phone_name — required string; non-empty model label.
- brand — optional category; normalize whitespace and casing.
- price_inr — required positive numeric price in Indian rupees; record source and verification date.
- ram_gb — optional positive numeric RAM in GB.
- storage_gb — optional positive numeric storage in GB.
- battery_mah — optional positive numeric capacity in mAh.
- camera_mp — optional numeric megapixel value; not a complete measure of camera quality.
- display_hz — optional positive numeric refresh rate in Hz.
- has_5g — optional boolean/0-1 field with normalized values.
- processor_score — optional numeric value only when benchmark source and scale are documented.
- source — optional source name or URL.
- verified_at — optional date last verified.

3. Data quality rules

- Document source, licence, attribution, retrieval date, and last verification date.
- Do not turn unknown/missing values into zero.
- Standardize units and data types.
- Inspect duplicate models and variants before deduplication.
- Flag implausible values for review rather than silently correcting them.
- Keep a record of transformations and missing-value handling.

4. Provenance template

- Dataset name: [fill in]
- Source URL/name: [fill in]
- Licence/usage terms: [fill in]
- Retrieved on: [fill in]
- Last verified: [fill in]
- Fields with missing values: [fill in]
- Redistribution allowed: [yes/no/unclear — verify before publishing]
